Both genetic engineering and artificial selection allow humans to change a species so that its members are better suited for human needs. However, the mechanism for change is different. Artificial selection selects for traits already present in a species, whereas genetic engineering creates new traits. In artificial selection, scientists breed only individuals that have desirable traits.

When combining two crops using standard agricultural techniques, genes are allowed to mix at random. A typical example is Triticale, a synthetic hybrid between wheat and rye grown in Europe, which is the result of combining 50,000 largely untested genes, 25,000 from each species. 10 GM crops, in contrast, have specific genes inserted to produce the same desired effect.
